IGNOU MPCL-007 Viva Questions and Answers

Experiment: Knowledge of Results (KOR)

Aim: To study the effect of Knowledge of Results (KOR) on performance.

What is meant by Knowledge of Results?: Knowledge of Results refers to providing feedback to the learner about the correctness or accuracy of their performance after each trial.

Independent Variable: Presence or absence of Knowledge of Results (KOR).

Dependent Variable: Level of performance (accuracy, correct responses, or time taken).

Hypothesis: Performance will be better when Knowledge of Results is given compared to when it is not given.

Design: Within-subjects design (same participants perform under both KOR and no-KOR conditions).

Materials Used: Mirror drawing apparatus or maze learning apparatus, stopwatch, record sheets, pencil/stylus.

Procedure: Participant performs under two conditions: (1) Without KOR and (2) With KOR. Feedback is given only in the KOR condition. Performances are compared.

Expected Result: Performance improves when Knowledge of Results is provided.

Principle: Feedback acts as reinforcement and aids in learning.

Difference between KOR and KOP: KOR: Feedback about outcome (correct/incorrect). KOP: Feedback about process or technique.

Type of Learning: Motor learning or skill learning.

Significance: KOR helps learners correct mistakes and accelerates learning.

Applications: Used in sports, education, and industrial training.

Factors Affecting KOR: Timing, frequency, type of task, learner's motivation.

Supporting Theory: Thorndike's Law of Effect and Skinner's Operant Conditioning Theory.

Data Analysis: Compare mean scores under KOR and No KOR using related samples t-test.

Conclusion: Performance is better under KOR, indicating feedback enhances learning.

Summary Table Example

Condition	Mean Performance (Correct Responses)
Without KOR	6.4

With KOR	9.1
