MPC-001 Assignment-

section-C

9.0 Levels-of-processing model

Ans:- The levels-of Processing model (LOP) is given by Craik and Lockhart's. Core concept of this model is that memory retention based on level-of-Processing. Any given data may lead to stronger memory traces when deeper Processing occured, compared to shallow level. Greater cognitive analysis is undertaken, with deeper processing.

10.9 Hebb's law

Ans:- Hebb's law, put forward by Donald Hebb in 1949. Hebb's law states that the synapse will be strengthened and the structure of neuron changes, when synapse between two neurons is frequently engaged at the same time.

Hebb's law states, that the synapse will be strengthened, the structure of neuron changes and the Postsynaptic neuron fires, when synapse between two neurons is frequently engaged at the same time.

Q11 Role of hippocampus in memory

Ans:- Hippocampus plays a vital role in forming new long term memory.

* Its not the containes of the stored knowledge. It helps in converting S.TM into long term memory. Damage to the hippocampus can result in severe memory impairments, Particularly in formin new memories.

Q12 Bloom's taxonomy of cognitive domain

Ans:- Bloom's taxonomy of cognitive domain classified information processing into six hierarchical levels of increasing complexity.

* knowledge
* Comprehension
* application
* Analysis
* Synthesis
* Evaluation

① Recalling Information

② Summarize information

③ Using concepts to solve a problem

④ Understanding relationship b/w parts and their organization

⑤ Creating something original by combining parts

⑥ Process of making judgement

Q13 :- Principles of the Information Processing

Ans :- Information of Processing is based on four key principles :

1] Limited capacity : The mental system has constraints on how much information it can process, with bottlenecks occuring at specific points in the processing flow.

2] Control mechanism : An executive function oversees the encoding, transformation, processing, storage, retrieval, and utilization of information, using more processing power for new tasks than routine.

3] Two-way Information: We constantly use both sensory input and stored memory to construct meaning about our enviroment.

4] Humans are biologically prepared to process and organize information in specific ways, as seen in language development patterns and attention preferences.

Q15 Relationship between creativity & Intelligence

Q16 Benefits of multilingualism

Ans:- Multilingualism offers significant cognitive benefits including enchanced executive functions, improved working memory, better cognitive flexibility, and superior problem-solving skills. Reasearch shows multilinguals out perform monolinguals in interference suppression tasks and demostrate greater metalinguistic awoareness.

Q17 Phonems and Morphemes

Phonems are the smallest
